

# GENERATION-4

## DIGITAL CONTROL SURFACE

**THE G-4 IS THE NEXT STEP** in the continuing evolution of Wheatstone's proven BRIDGE technology. It's the perfect complement to the larger WHEATSTONE GENERATION-9, providing many of the same features but in a simplified, smaller footprint. It too is based on Wheatstone's BRIDGE technology and BRIDGE mixing engine.

THE GENERATION-4 SURFACE controls Wheatstone's G-4 mixing engine, which plugs directly into existing BRIDGE cage systems to give you control of thousands of sources and destinations. It allows the creation of a platform-based system whereby 50 surfaces can be configured to share sources, destinations and control signal information. BRIDGE cages, which provide the location for all I/O ports and engine cards, can be wired in tandems within a single equipment room, or be interconnected by means of fiberoptic or CAT-5 wires to provide a single-wire studio integration scheme. The system can support up to one hundred remote/satellite cages. Large multiple

studio builds are easily accommodated. And because it is an embedded system, the resulting network operates independently of external computers, which are only required for initial system configuration or to accommodate desktop based software controllers.

THE CONFIGURATION SOFTWARE is extremely user-friendly, giving your field engineers the power of complete control. Expansion and changes can be achieved painlessly. Naturally, the system takes full advantage of Wheatstone's VDIP® configuration software as well, so studio functions (like mutes, fader and timer starts, tallies, etc.) are easily accomplished right at your desktop—and with ethernet protocol built in, automation, scheduling, and hardware controllers are easily integrated into the system.

WHEATSTONE has built its digital platform through many years of experience in the field. We offer more digital (and analog) products than most of our competitors combined. Benefit from our extensive technology base. CHOOSE WHEATSTONE—THE DIGITAL AUDIO LEADER!
